

ORDER NO. KM40112760C3

Service Manual

Telephone Equipment

2 LINE

KX-T2378JXW

Intergrated Telephone System

White Version

(for Asia, Middle Near East and Other Areas)

SPECIFICATIONS

■ SPECIFICATIONS

Power Source:	Telephone line voltage
Dial Speed:	Tone(DTMF)/Pulse(10pps)
Redial:	Last dialed telephone number
Speaker Unit:	5.7cm (2.5") PM magnetic type 32Ω Handset; 3 cm (1 ¹³ / ₁₆) PM dynamic type, 150 Ω
Microphone:	Electret condenser microphone
Input Jack:	Telephone Line, Data port
Dimensions:	6 ⁹ / ₁₆ " × 8 ¹³ / ₁₆ " × 3 ³ / ₄ " (167 × 224 × 95 mm)
Weight:	1.61 lbs. (730g)

Design and specifications are subject to change without notice.

WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

When you note the serial number, write down all 11 digits. The serial number may be found on the bottom of the unit.

FOR SERVICE TECHNICIANS

ICs and LSIs are vulnerable to static electricity.

When repairing, the following precautions will help prevent recurring malfunctions.

1. Cover plastic parts boxes with aluminum foil.
2. Ground the soldering irons.
3. Use a conductive mat on worktable.
4. Do not grasp IC or LSI pins with bare fingers.

Panasonic

1. LOCATION OF CONTROLS

2. DISPLAY

(This display shows all of the possible configurations.)

12-000 : In the standby mode, the display shows the current time.
(Ex. 12:00AM)

02-14-30 : During a conversation, the call duration is displayed.
(Ex. 2 hours, 14 minutes, 30 seconds)

F : **FLASH** was pressed.

P : **PAUSE** was pressed while storing phone numbers.

*** : ***** was pressed while dialing.

: **#** was pressed while dialing.

AUTO/LOWER : **AUTO/LOWER** was pressed.

MUTE : **MUTE** was pressed during a conversation.

Clock icon : The unit is in the clock setting mode.

Right arrow icon : The unit is in the programming mode.

Dial lock icon : The dial lock mode is set.

Battery icon : This display flashes, when the battery power is low.

3. CONNECTION

3.1. Connecting the Handset

Connect the handset as shown below.

- Use only a Panasonic Handset for the KX-T2378JXW.

3.2. Connecting the Telephone Line Cord

Connect the telephone line cord(s) to the unit as follows.

To connect a two-line telephone jack

To connect two single-line telephone jacks

If you use the unit only as a single-line telephone

3.3. Connecting a Communication Device

After connecting the telephone line cord to a two-line telephone jack, you can connect a communication device (computer, modem, fax, answering machine, etc.) through this unit using the LINE2/DATA jack.

- If the LINE2/DATA indicator lights red, the communication device is in use. Use LINE1 to make or answer other calls. Otherwise the communication device may not operate properly.

4. SETTINGS

*** To Set the Each Settings (4.1. ~ 4.4.) Back to the Factory Default < for Service >**

You can set the each settings (4.1. ~ 4.4.) back to the factory default by taking off the battery and leave the unit for a while (about 3 minutes).

4.1. Selecting the Dialing Mode

You can select the dialing mode by programming. If you have touch tone service, set to "Tone". If rotary or pulse service is used, set to "Pulse". Your phone comes from the factory set to "Tone". Make sure that a call is not put on hold.

1 Press **PROGRAM**.

2 Press **MUTE**.

3 Press **3**.
•The current setting is displayed.

4 To select "Pulse", press **2**.
OR
To select "Tone", press **1**.

5 Press **PROGRAM**.
•A long beep sounds.
•The unit will return to the standby mode.

4.2. Time Adjustment

You can select AM/PM or 24-hour clock by programming.
Make sure that a call is not put on hold.

1 Press **PROGRAM**.

2 Press **MUTE**.

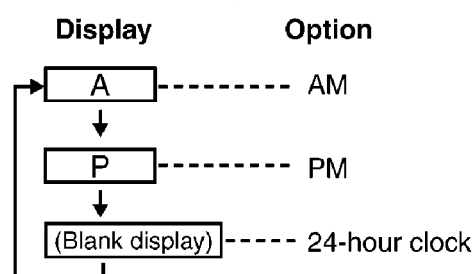

3 Press **6**.

4 Enter the current time (hour and minute) using a 4-digit number.
(Ex. To set 9:30, enter "0930".)

5 Press **#** to select AM, PM or 24-hour clock.
(Ex. You select PM.)

- Each time you press **#**, the selection will change on the display.

6 Press **PROGRAM**.

- A long beep sounds.
- The clock starts working.
- If an alarm sound is heard when entering the time and pressing **PROGRAM**, the time entered are not correct. Enter the correct time and press **PROGRAM**.
- The unit will return to the standby mode.

If the batteries installed in the unit have expired, the time will be shown as "12-00" and "⊖" will flash. Readjust the time.

4.3. Setting the LCD Contrast

You can select the LCD contrast level from 1 to 4 by programming. Your phone comes from the factory set to 3.

Make sure that a call is not put on hold.

1 Press **PROGRAM**.

2 Press **MUTE**.

3 Press **7**.
•The current setting is displayed.

4 Press **1** to **4**.
•Each time you press a button, the level will change on the display.

5 Press **PROGRAM**.
•A long beep sounds.
•The unit will return to the standby mode.

4.4. Selecting the Ringer Volume

You can select the ringer volume of each line to HIGH, LOW or OFF. Your phone comes from the factory set to HIGH.

5. SPECIAL FEATURES

*** To Set the Each Settings (5.1. ~ 5.6.) Back to the Factory Default < for Service >**

You can set the each settings (5.1. ~ 5.6.) back to the factory default by taking off the battery and leave the unit for a while (about 3 minutes).

5.1. FLASH Button

Pressing **FLASH** allows you to use special features of your host PBX such as transferring an extension call or accessing special telephone services (optional) such as call waiting.

5.2. Selecting the Flash Time

The flash time depends on your telephone exchange or host PBX. You can select the following

flash times: "80, 90, 100, 110, 200, 250, 300, 400, 600, 700 ms (milliseconds)". Your phone comes from the factory set to "600 ms".

Make sure that a call is not put on hold.

1 Press **PROGRAM**.

2 Press **MUTE**.

3 Press **2**.
•The current setting is displayed.

4 Press a dialing button (**1** to **0**).

1 : 80 ms	2 : 90 ms	3 : 100 ms	4 : 110 ms
5 : 200 ms	6 : 250 ms	7 : 300 ms	8 : 400 ms
9 : 600 ms	0 : 700 ms		

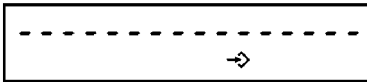

5 Press **PROGRAM**.
•A long beep sounds.
•The unit will return to the standby mode.

- If you are connected via a PBX, a longer flash time may be necessary to use PBX functions (transferring a call, etc.). Consult your PBX installer for the correct setting.

5.3. Setting the Pin Code

A 4-digit PIN Code (Personal Identification Number) prevents unauthorized persons from using your unit. The PIN Code is required for the dial lock and call restriction to be set or canceled. The factory preset PIN code is "1111".

Make sure that a call is not put on hold.

- 1 Press **PROGRAM**.

- 2 Press **MUTE**.

- 3 Press **5**.

- 4 Enter the current PIN code.
 (Ex. "1111" is entered.)

- 5 Press **PROGRAM**.
 - If a correct PIN code is entered, a beep will sound.
 - If a wrong PIN code is entered, 3 beeps will sound. Enter the correct PIN code and press **PROGRAM**.
 - To return to the standby mode, lift the handset and hang up.
- 6 Enter a new PIN code using a 4-digit number.
 (Ex. "1234" is entered.)

- 7 Press **PROGRAM**.
 - A long beep sounds.
 - The unit will return to the standby mode.

5.4. Dial Lock

You can prevent others from making a call to any number except the one pre-programmed in the memory of the **EMERGENCY** button. Once you locked the dialing buttons, even emergency numbers cannot be dialed. Only incoming calls are accepted until the dial lock is canceled. Before using this feature, we recommend storing an emergency number in the memory of the **EMERGENCY** button. Even if the dialing buttons are locked, the number stored in the button can be dialed.

- If you choose not to program emergency numbers, but plan to use the dial lock, any number programmed into the EMERGENCY button can be accessed.

5.4.1. To Set the Dial Lock

- 1 Press **DIAL LOCK**.
• "⏏" flashes on the display.

- 2 Enter the PIN code.

- 3 Press **PROGRAM**.
• "⏏" is displayed.
• A long beep sounds.
• If a wrong PIN code is entered, 3 beeps will sound. Enter a correct PIN code and press **PROGRAM**.
• The unit will return to the standby mode.

You can use the following features while the dialing buttons are locked.

- Dialing a number you programmed into the memory of the EMERGENCY buttons.
- Adjusting the handset and speakerphone volumes.
- Muting the conversation.
- Answering the second call by pressing **FLASH**.

5.4.2. To Cancel the Dial Lock

Follow steps 1 through 3 above again.

- "⏏" will disappear, and the unit will return to the standby mode.

5.5. Call Restriction

You can prevent the unit from dialing phone numbers beginning with specified digit(s) (1 digit or 2 digits). Phone numbers with the restricted leading digits cannot be dialed out.

5.5.1. To Set the Call Restriction

Make sure that a call is not put on hold.

1 Press **PROGRAM**.

2 Press **MUTE**.

3 Press **1**.

- If you use "1111" as a PIN code (factory set), the display on the right will be shown. There is no need to enter a PIN code.
- After the PIN code is changed, "- - - -" will be displayed.

4 Enter the PIN code.
(Ex. Your PIN code is "1234".)

5 Press **PROGRAM**.

- If a wrong PIN code is entered, 3 beeps will sound. Enter a correct PIN code and press **PROGRAM**.
- The current setting is displayed. (Ex. "67" is entered as the restricted digits.)

6 Enter the number(s) (1 digit or 2 digits) you want to restrict (**0** to **9**). (Ex. "12" is entered as the restricted digits.)

- If you enter a wrong number, enter a correct number.
- To change restricted digits from 2 digits to 1 digit, press **✖** for 2 digits to change to "- -" and enter 1 digit.

7 Press **PROGRAM**.

- A long beep sounds.
- The unit will return to the standby mode.

- If your unit is connected to a PBX, this function may not operate.
Contact your PBX supplier for more information.

5.5.2. To Cancel the Call Restriction

Follow steps 1 through 5 of **5.5.1. To Set the Call Restriction**. In step 6, press ***** to cancel call restriction ("—" is displayed) and press **PROGRAM**.

•A long beep will sound and the unit will return to the standby mode.

5.6. How to Release the Establishment of Dial Lock

After this procedure, you will be able to establish a new password.
How to release the establishment of dial lock.

1 Press **PROGRAM**.

2 Press **MUTE**.

3 Press **5**.

4 Enter "10349276" for initialling of password.

5 Press **PROGRAM**.

6 Enter a new password 4 digits code by dial key pad (ex. "1234").

If you want to set the password for "DIAL LOCK" to "1 1 1 1" (factory set), you should enter "1 1 1 1".

7 Press **PROGRAM**.

After this procedure, the password for "DIAL LOCK" will be returned to "1 2 3 4".

8 To cancel the Dial Lock, follow 5.4.2. **To Cancel the Dial Lock.**

6. DISASSEMBLY INSTRUCTIONS

Fig 1

Fig 2

Fig 3

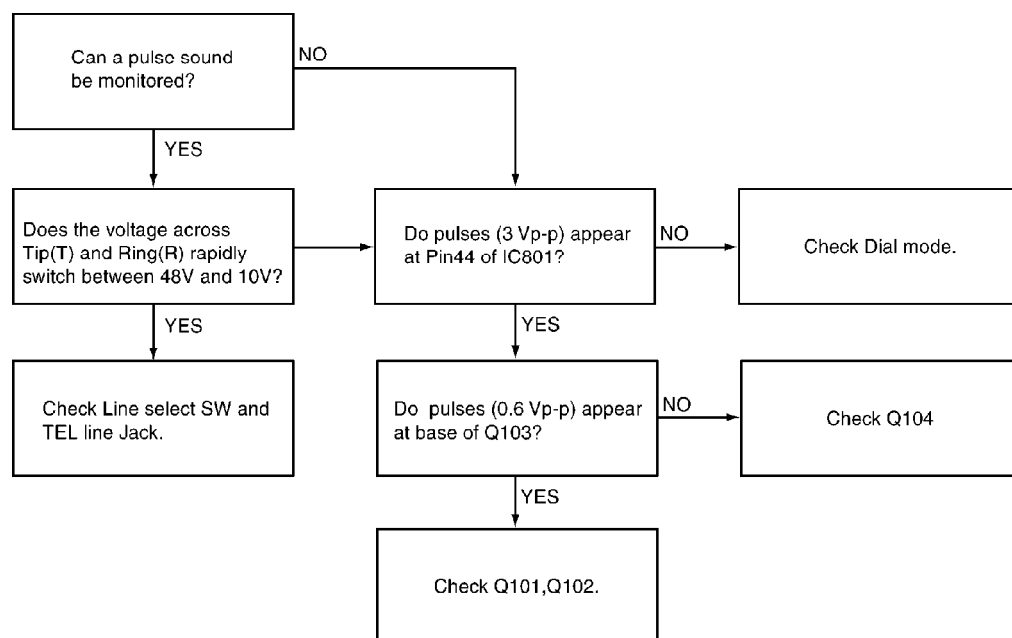

Shown in Fig —.	To remove —.	Remove —.
1	Lower Cabinet	Screws (2.6 × 12).....(A) × 5

	Battery Box	The Battery Box
3	Operational P.C. Board	Screws (2.6 × 8).....(B) × 5

7. TROUBLE SHOOTING GUIDE

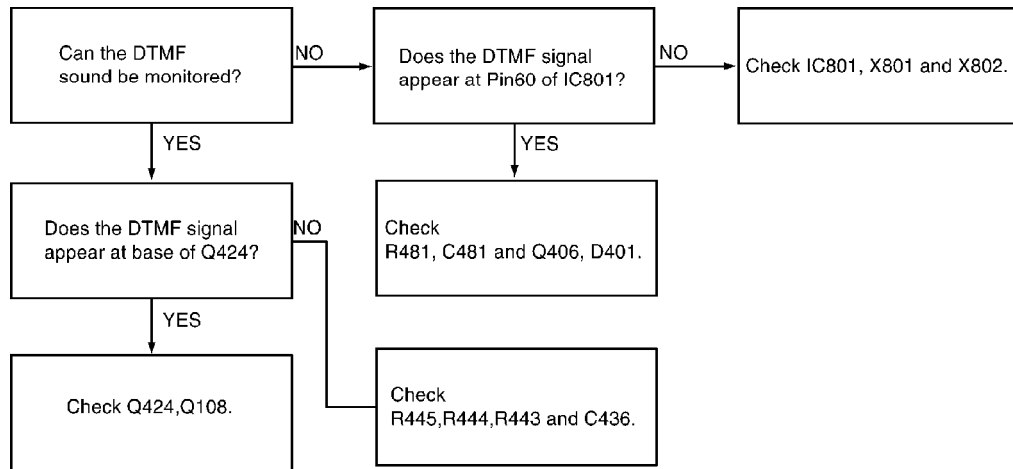

7.1. Service Hints

SYMPTOM	CURE
Dead	Check IC801, X801, X802
Can't hear the voice from handset.	Check Q109, Q405, Q406.
No voice transmit.	Check Q421, Q424, Q108.
Can't tone dial.	Check IC801, R445, R444, R443, C436.
Can't pulse dial	Check Q101, Q103, Q104.
Can't auto redial	Check IC201, Q201.
No rings.	Check D1, IC1 and SW1 (Line1), D21, IC22 and SW21 (Line 2).
can't speak with the speakerphone.	Check IC601.
Can't hold.	Check SW510, Q501, Q551.
Can't speak with the handset.	Check handset jack
Can't speak with the headset.	Check headset jack
Can't change the volume for speakerphone.	Check IC801, IC601
Can't change the volume for handset.	Check IC801, Q405
No volume handset or speakerphone.	Check IC801, Q108, Q401.

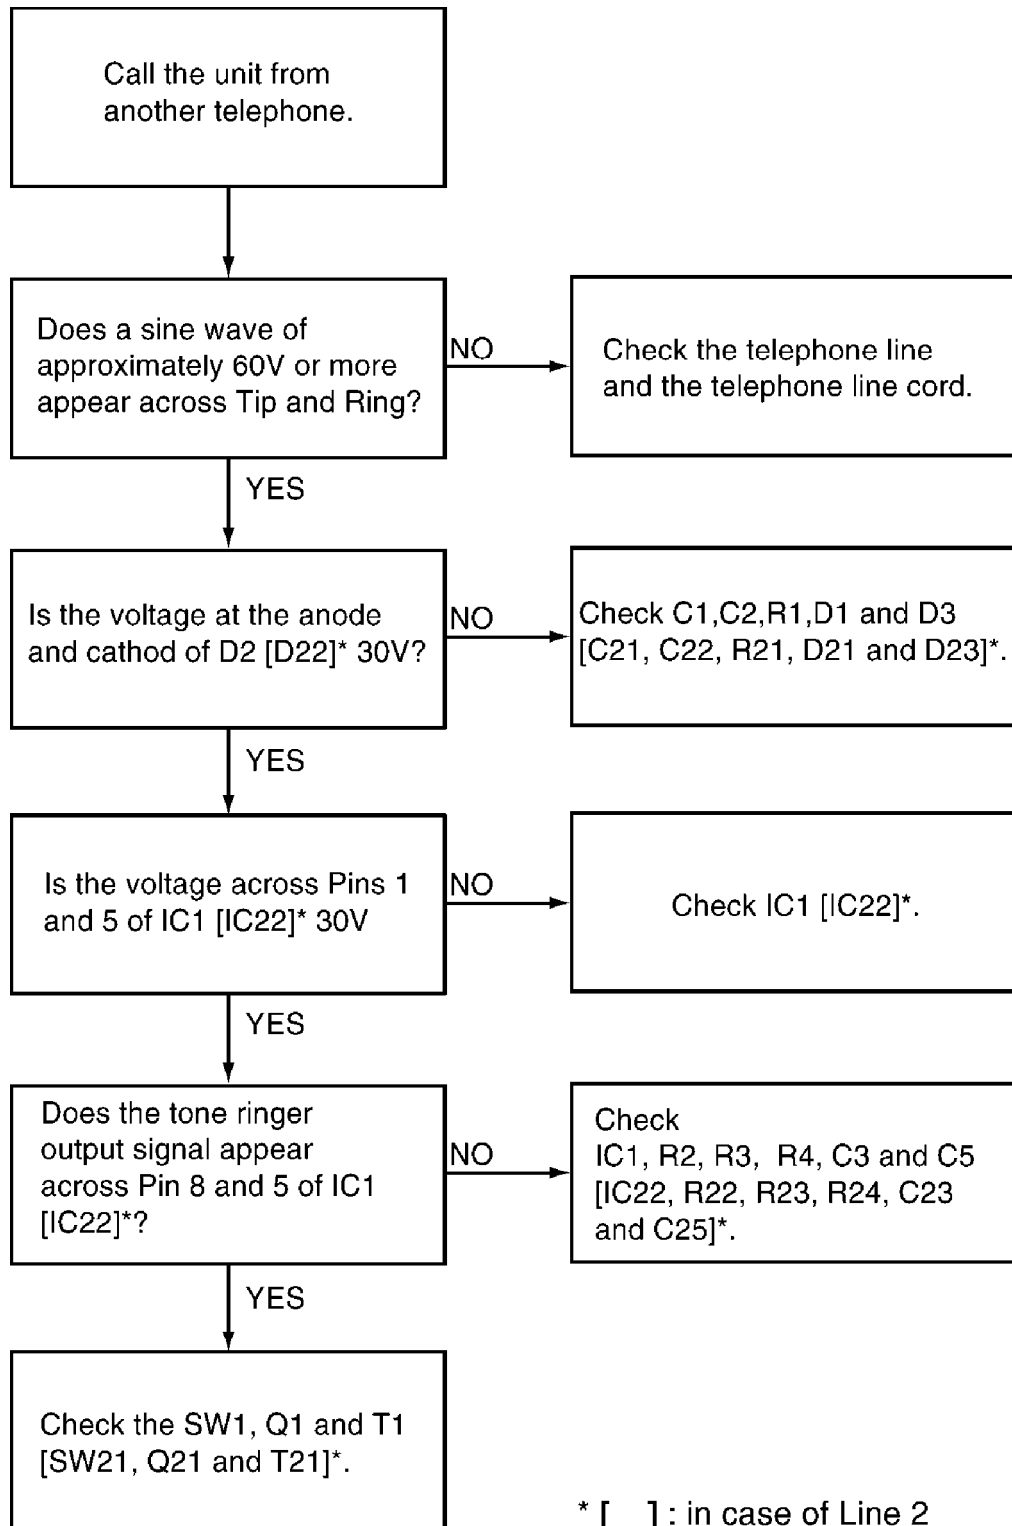

7.2. Pulse Dialing Problems

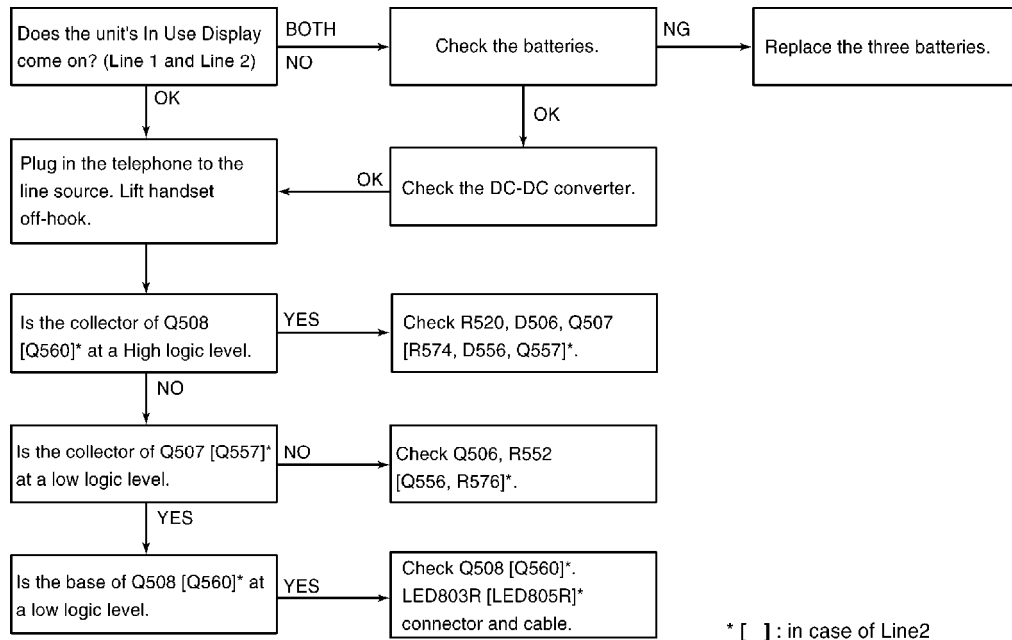

7.3. Tone Dialing Problems (Handset)

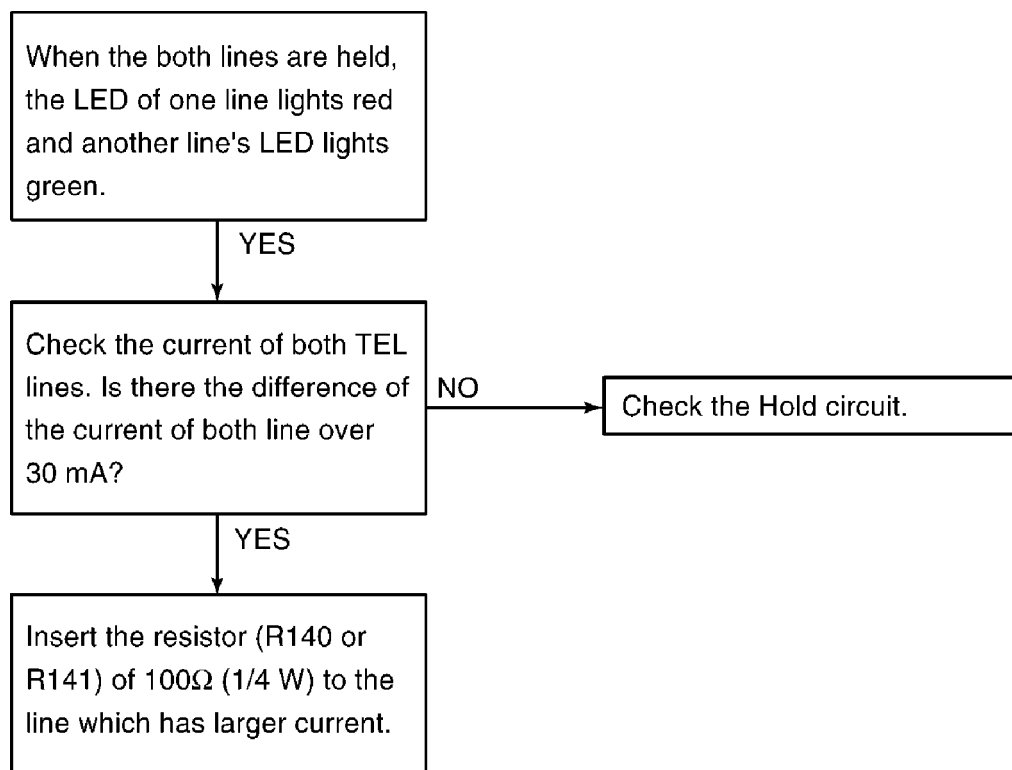

7.4. No Ringing Sound When Ring Signal is Input.

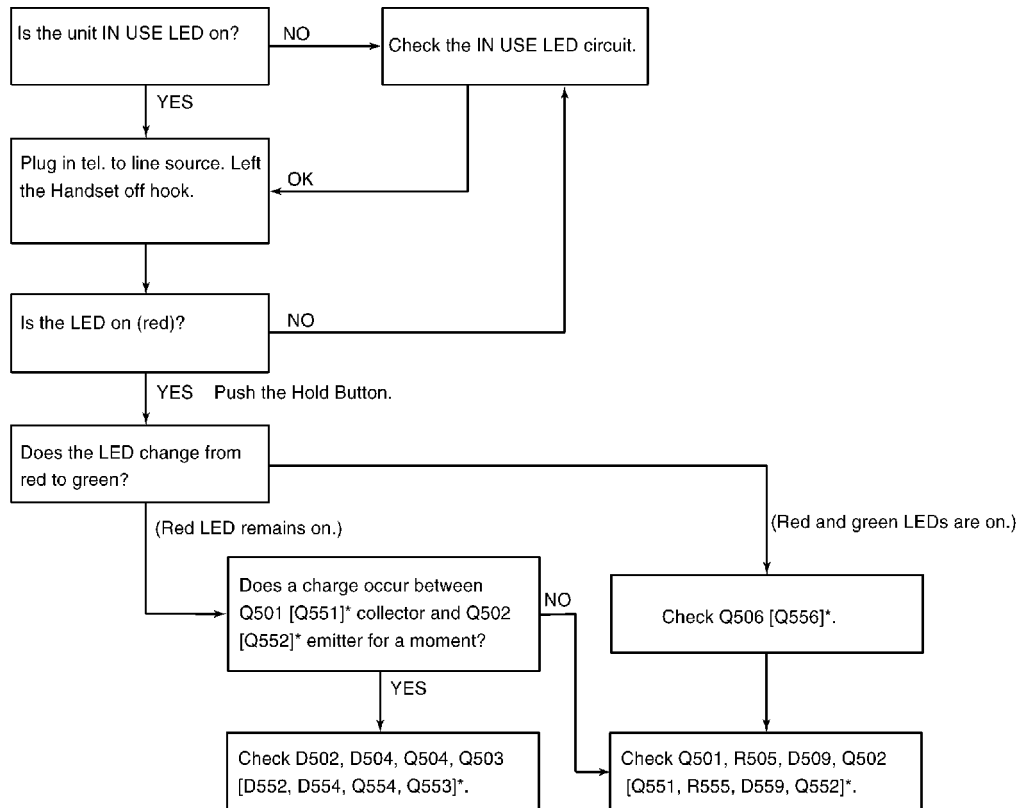

7.5. In Use LED is Not On

7.6. When the both lines are held in the Conference mode; Line LED are not Green

7.7. Does Not Hold

* [] : in case of Line2

8. BLOCK DIAGRAM

9. CIRCUIT OPERATION

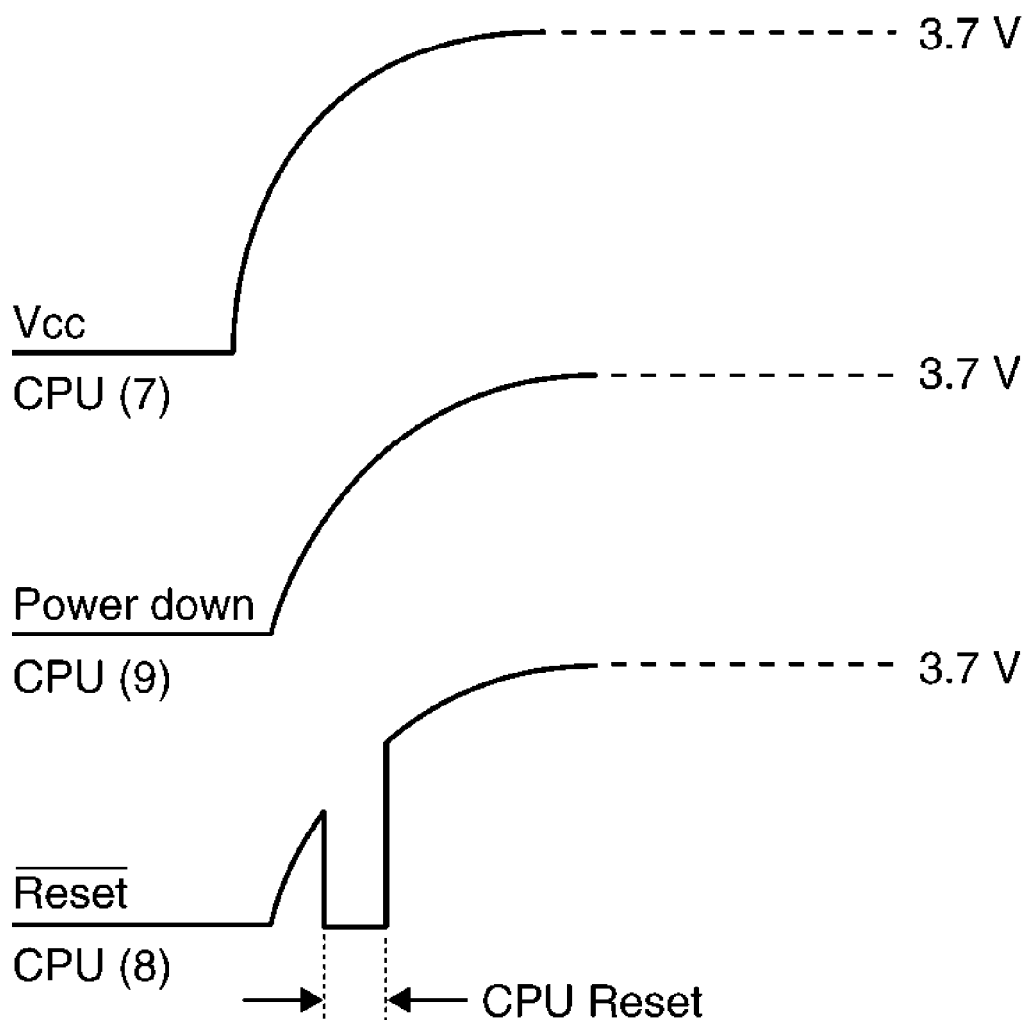

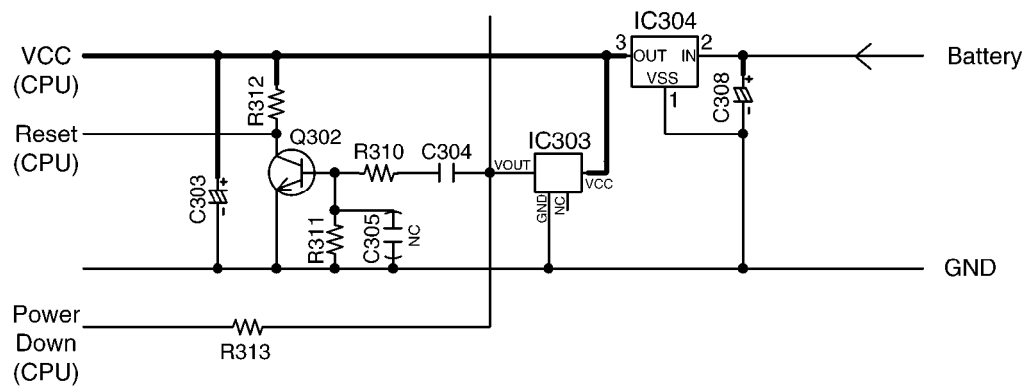

9.1. Reset Circuit

9.1.1. Function

This circuit is used for to reset the microcomputer when inserting batteries.

9.1.2. Circuit operation

When the batteries is inserted into the unit, then the voltage is shifted by D304 and power is supplied to the CPU as shown below.

9.2. Telephone Line Interface

9.2.1. Circuit operation

- On hook

Q101 is open, Q101 is connected as to cut DC loop current and cut the voice signal.

- Off hook (in case of Line 1)

In talk status, RLY output from IC801 (45) changes to low level, causing Q103, Q101 to turn on and resulting in a line loop.

Q101 turns on thus providing an off-hook condition (active DC current flow through the circuit) and the following signal flow is for the DC loop current.

(Line 1) Tip → POS101 → D110 → SW110 → Q101 → Q108 → R124 → D106 → D110 → (Line 1) Ring

- Pulse mode

A pulse signal that repeated switches between high and low logic is output from IC801 (44).

This switches the line loop on and off, generating the dial pulse signal.

- The receiving signal flows: (in case of Line 1)

TEL line → POS101 → SW110 → Q101 → C113 → R125 → C108 → Q109 → Q405 → Q406 → CN401 → CN402 → Speaker (H/S)

- The transmission signal flows: (in case of Line 1)

Mic → Q421 → Q424 → C435 → R437 → Q108 → SW110 → Pos101 → Tel Line

9.3. Ringer Circuit

When the bell signal is input between telephone line, the signal are output at the speaker via the following path:

Tel line → R1/C1 [R21/C21] → D1 [D21] → IC1 (1) [IC22 (1)] → IC1 (8) [IC22 (8)] → C5 [C35] → T1 [T21] → C625 → Speaker

[] : in case of Line2

9.4. Tone Detect

This circuit is used to sense the status of the line (busy tone or dial tone) during Auto Redial.

9.4.1. Circuit operation

D110 → Q101 → C201 → R201 → R205 → IC201 (5) → IC201 (1) → D202 → R208 → Q201 → IC801 (50)

When the subscriber hangs-up, check the intermittent tone. If cycle tone is detected, the collector of Q201 goes to a low logic.

9.5. In Use Detector Circuit

9.5.1. Function:

This circuit is designed to automatically provide an LED indication when either one telephone or another telephone which is connected in parallel across the line is engaged.

9.5.2. Circuit Description

Battery \rightarrow T351 (6) \rightarrow T351 (5) \rightarrow collector of Q351
 \downarrow
 R351 \rightarrow base of Q351

Q351 turns ON. Then the DC is converted at T351 (9 pin \rightarrow +, 8 pin \rightarrow -). Q352 base becomes (High) and Q352 turns ON.

When Q352 is ON, Q351 base becomes (Low) and Q351 turns OFF. And no electric current flows in the collector of Q351.

Thus Q351 starts oscillating.

In this circumstance voltage is generated at T351 (1, 2) as well as T351 (3, 4).

This output voltage is then rectified by D351 and D352, and smoothed by C351, C352 thus supplied to the IN USE circuits of Line 1 and Line 2 respectively.

- Off hook

When the circuit voltage is less than 18 V (unit and telephone are on-hook).

**Telephone Line → D110 [D111] → D506 [D556] OFF → R520 [R570]
→ Q506 [Q506] base a low level. →**

Q506 [Q556] OFF → Q507 [Q557] base a high level. →

**Q507 [Q557] ON → Q508 [Q560] ON → D507 [D557] → R821 [R823]
→ LED D803-R [LED D805-R] ON.**

- On hook

When the circuit voltage is more than 18 V (unit and telephone are on-hook).

**Telephone Line → D110 [D111] → D506 [D556] ON → R520 [R570]
→ Q506 [Q506] base a high level. →**

Q506 [Q556] ON → Q507 [Q557] base a low level. →

Q507 [Q557] OFF → Q508 [Q560] OFF → LED D803-R [LED D805-R] OFF.

[] : in case of Line2

9.6. Hold Circuit

9.6.1. Function

The HOLD circuit holds the line from the talk condition.
The green LED light at the time of holding.

9.6.2. Circuit Description

- Hold on

When line 1 [line 2] is selected with HOLD switch and the handset is off-hook, Q508 [Q560] goes ON and IN USE LED D803-R [D805-R] lights. At this time, C507 [C557] is charged. When the Hold key is depressed, Q501 [Q551] is triggered and the hold circuit comes on.

R118 → D103 → C507 [C557] is charged. When the Hold key is depressed, current flows as follows → C507 [C557] → SW110 [SW120] → SW510 [SW510] → D509 [D559] → R505 [R555] → Q502 [Q552] ON.

Telephone Line → Q501 [Q551] ON → Q505 [Q555] ON → D502 [D552] → Q503 [Q553] ON → D508 [D556] →
D503 [D553] ON → Q504 [Q554] ON → R504 [R554] → Q502 [Q552] ON.

At this time, the LED D803-R [D805-R] for the IN USE indicator goes out and green LED D803-G [D805-G] for Hold indicator lights.

Q501 [Q551] collector → D803-G [D805-G] ON.

- Hold Cancellation

When the line select switch is pressed ON and the voltage drops because of the handset going off-hook or another telephone connected in parallel has been raised (off-hook), Q504 [Q554] goes OFF → Q503 [Q553] goes OFF → Q502 [Q552] goes OFF, and hold is cancelled.

[] : in case of Line2

9.7. Speakerphone Circuit

9.7.1. Function

The circuit controls the automatic switching of the transmitted and received signals, to and from the telephone line, when the unit is used in the hands -free mode.

9.7.2. Circuit Operation

The speakerphone can only provide a one-way communication path.

In other words, it can either transmit an outgoing signal or receive an incoming signal at a given time, but cannot do both simultaneously. Therefore, a switching circuit is necessary to control the flow of the outgoing and incoming signals.

This switching circuit is contained in IC601 and consists of a Voice Detector, TX Attenuator, RX Attenuator, Comparator and Attenuator Control. The circuit analyzes whether the TX(transmit) or the RX(receive) signal is louder, and then it processes the signals such that the louder signal is given precedence.

The Voice Detector provides a DC input to the Attenuator Control corresponding to the TX signal. The Comparator receives a TX and a RX signal, and supplies a DC input to the Attenuator Control corresponding to the RX signal.

The Attenuator Control provides a control signal to the TX and the RX attenuator to switch the appropriate signals on and off. The Attenuator Control also detects the level of the volume control to automatically adjust for changing ambient conditions.

1. Transmission signal path:

The input signal from the microphone is sent through the circuit via the following path:

MIC → IC601 (9 → 10 → 3 → 4) → R601 → C602 → Q108 → Tel line.

2. Reception signal path:

Signals receive from the telephone line are outputted at the speaker via the following path:

Tel line → Q108 → Q109 → C112 → R600 → C603 → IC601 (27 → 26 → 19 → 15) → Speaker.

3. Transmission/Reception switching

The comparison result between TX and RX outputs as a DC level of IC601 (25), In short the voltage difference between IC601 (20) and IC601 (25) switches TX/RX.

4. Voice detector

The output of the Mic Amp (IC601 (10)) is supplied to IC601 (13) as a control signal for the voice detector.

5. Attenuator control

The attenuator control detects the setting of the volume control through IC601 (24) to automatically adjust for changing ambient

conditions.

10. HOW TO SET THE FLASH TIME AND REDIAL TIME

*Refer to [Flow Solder Side View \(Operation\)](#) ()

10.1. Flash Time

D801—D804 are used for default setting.

When you change the flash time, do the following procedure.

In case the program should be set frequency, change the default at D801—D804, then set the program.

FLASH TIME	700 msec.	600 msec.	400 msec.	300 msec.	250 msec.	200 msec.	110 msec.	100 msec.	90 msec.	80 msec.
D801	1	0	0	0	0	0	0	0	0	1
D802	1	0	0	0	0	1	1	1	1	0
D803	1	0	0	1	1	0	0	1	1	0
D804	1	0	1	0	1	0	1	0	1	0

0= Without

1= With

10.2. Redial Time

Auto Redial Times	15	10	4	Once
D805	0	0	1	1
D806	0	1	0	1

0= Without

1= With

11.2. Speakerphone IC Data (IC601)

Pin NO.	Name	Description
1	RR	A resistor to ground provides a reference current for the transmit and receive attenuators.
2	RTX	A resistor to ground determines the nominal gain of the transmit attenuator. The transmit channel gain is inversely proportional to the RTX resistance.
3	TXI	Input to the transmit attenuator. Input resistance is nominally 5.0 kohms.
4	TXO	Output to the transmit attenuator. The TXO output signal drives the input of the transmit detector, as well as the external circuit which drives the telephone line.
5	TLI	Input of the transmit level detector. An external resistor ac coupled to the TLI pin sets the detection level. Decreasing this resistor increases the sensitivity to transmit channel signals.
6	TLO	Output of the transmit level detector. An external resistor and capacitor set the time the comparator will hold the system in the transmit mode after speech ceases.
7	RLI	Input of the receive level detector. An external resistor ac coupled to the RLI pin sets the detection level. Decreasing this resistor increases the sensitivity to receive channel signals.
8	RLO	Output of the receive level detector. An external resistor and capacitor set the time the comparator will hold the system in the receive mode after the receive signal ceases.
9	MCI	Microphone amplifier input. Input impedance is nominally 10 kohms and the dc bias voltage is approximately equal to VB.
10	MCO	Microphone amplifier output. The mic amp gain is internally set at 34 dB (50 V/V).
11	CP1	A parallel resistor and capacitor connected between this pin and Vcc holds a voltage corresponding to the background noise level. The transmit detector compares the CP1 voltage with the speech signal from CP2.
12	CP2	A capacitor at this pin peak detects the speech signals for comparison with the background noise level held at CP1.
13	XDI	Input to the transmit detector system. The microphone amplifier output is ac coupled to this pin through an external resistor.
14	SKG	High current ground pin for the speaker amp output stage. The SKG voltage should be within 10 mV of the ground voltage at pin 22.
15	SKO	Speaker amplifier output. The SKO pin will source and sink up to 100 mA when ac coupled to a speaker. The speaker amp gain is internally set at 34 dB (50 V/V).
16	V+	Input dc supply voltage. V+ can be powered from Tip and Ring if an ac decoupling inductor is used to prevent loading ac line signals. The required V+ voltage is 6.0 to 11 V (7.5 V nominal) and the current is up to 7.0 mA.
17	AGC	A capacitor from this pin to VB stabilizes the speaker amp gain control loop, and additionally controls the attack and decay time of this circuit. The gain control loop limits the speaker amp input to prevent clipping at SKO. The internal resistance at the AGC pin is nominally 110 kohms.
18	CS	Digital chip select input. When at a Logic "0" (<0.7 V) the Vcc regulator is enabled. When at a Logic "1" (>1.6 V), the chip is in the standby mode drawing 0.5 mA. An open CS pin is a logic "1". Input impedance is nominally 140 kohms. The input voltage should not exceed 11 V.
19	SKI	Input to the speaker amplifier. Input impedance is nominally 20 kohms.
20	Vcc	A 5.4 V regulated output which powers all circuit except the speaker amplifier output stage. Vcc can be used to power external circuitry such as a microprocessor (3.0 mA max). A filter capacitor is required. The MC 34018 can be powered by a separate regulated supply by connecting Vcc to a voltage between 4.5 V and 6.5 V while maintaining CS at a Logic "1".
21	VB	An output voltage equal to approximately Vcc/2 which serves as an analogue ground for the speakerphone system. Up to 1.5 mA of external load current may be sourced from VB. C input impedance is 250 ohms. A filter capacitor is required.
22	Gnd	Ground pin for the IC (except the speaker amplifier).

Pin NO.	Name	Description
23	XDC	Transmit detector output. A resistor and capacitor at this pin hold the system in the transmit mode during pauses between words or phrases. When the XDC pin voltage decays to ground, the attenuators switch from the transmit mode to the idle mode. The internal resistor is nominally 2.6 kohms.
24	VLC	Volume control input. Connecting this pin to the slider of a variable resistor provides remote volume control. The VLC pin voltage should be less than or equal to V_B .
25	ACF	Attenuator control filter. A capacitor connected to this pin reduces noise transients as the attenuator control switches levels of attenuation.
26	RXO	Output of the receive attenuator. Normally this pin is ac coupled to the input of the speaker amplifier.
27	RXI	Input of the receive attenuator. Input resistance is nominally 5.0 kohms.
28	RRX	A resistor to ground determines the nominal gain of the receive attenuator. The receive gain is directly proportional to the RRX resistance.

11.3. Ringer IC Data (IC1, IC22)

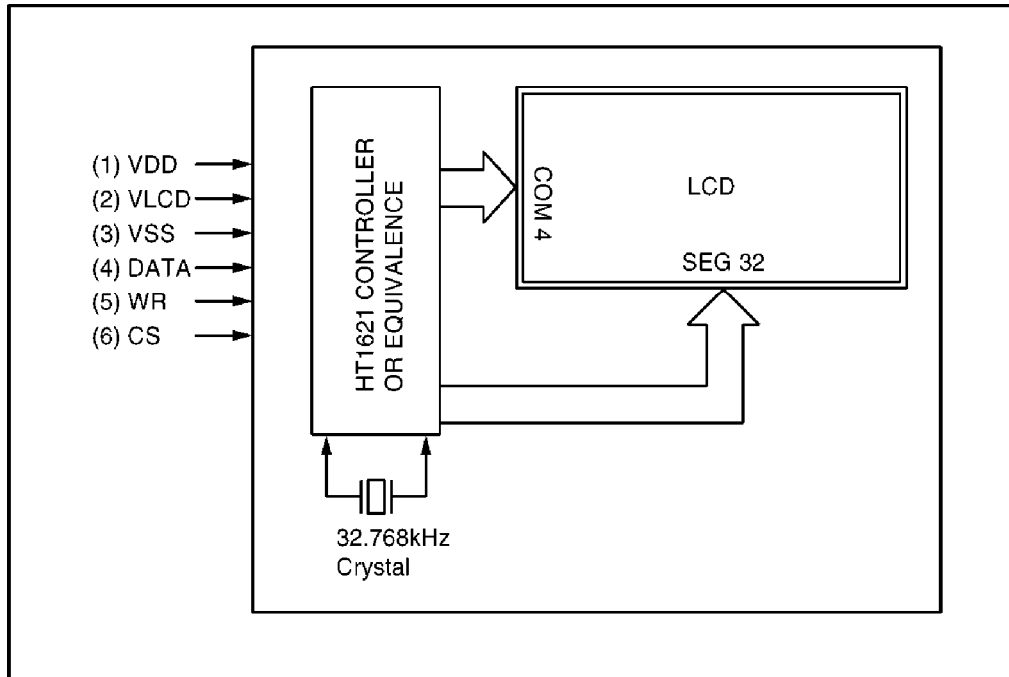

Pin descriptions

Pin No.	Pin name	Name	Function
1	Vcc	Power supply pin	This is the power supply pin for the IC. It is connected to the (⊕) pin of the diode bridge.
2	RSL	RSL pin	This is used to change the operation initiation current when connected to the GND pin.
3	LFI	Low-frequency time constant connector pin	This is connected to the time constant that determines the oscillation frequency on the warble.
4	LFO		
5	GND	GND pin	This pin has the lowest potential on the IC. It is connected to the (⊖) pin of the diode bridge
6	HFO	High-frequency time constant connector pin	This is connected to the time constant that determines the oscillation frequency on the tone side (the audible frequency side).
7	HFI		
8	OUT	Output pin	This is used to connect a piezoelectric buzzer, or to connect a dynamic speaker through a transformer.

13. HOW TO REPLACE FLAT PACKAGE IC

13.1. Preparation

- SOLDER

Sparkle Solder 115A-1, 115B-1 or Almit Solder KR-19, KR-19RMA

- Soldering iron

Recommended power consumption will be between 30 W to 40 W.

Temperature of Copper Rod $662 \pm 50^{\circ}\text{F}$ ($350 \pm 10^{\circ}\text{C}$)

(An expert may handle between 60 ~ 80 W iron, but beginner might damage foil by overheating.)

- Flux

HI115 Specific gravity 0.863

(Original flux will be replaced daily.)

13.2. Procedure

1. Temporary fix FLAT PACKAGE IC by soldering on two marked 2 pins.

*Most important matter is accurate setting of IC to the corresponding soldering foil.

● - - - - - Temporary soldering point.

2. Apply flux for all pins of FLAT PACKAGE IC.

- - - - - Flux

3. Solder employing specified solder to direction of arrow, as sliding the soldering iron.

13.3. Modification Procedure of Bridge

1. Re-solder slightly on bridged portion.
2. Remove remained solder along pins employing soldering iron as shown in below figure.

17. REPLACEMENT PARTS LIST

Note:

1. RTL (Retention Time Limited)

The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability depends on the type of assembly and the laws governing parts and product retention.

At the end of this period, the assembly will no longer be available.

2. Important safety notice

Components identified by the  mark indicates special characteristics important for safety. When replacing any of these components, only use specified manufacture's parts.

3. The S mark means the part is one of some identical parts. For that reason, it may be different from the installed part.

4. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (Ω) K=1000 Ω , M=1000k Ω

All capacitors are in MICRO FARADS (μ F) P= μ μ F

18. FOR SCHEMATIC DIAGRAM (SCHEMATIC DIAGRAM (BASE UNIT))

1. DC voltage measurements are taken with electronic voltmeter from negative terminal.
(Add 40 mA to telephone line from the loop simulator.)
2. This schematic diagram may be modified at any time with the development of new technology.

Important Safety Notice: / Components identified by  mark have special characteristics important for safety. When replacing any of these components, use only the manufacturer's specified parts.
